Health Checkup Packages for Screening Hypertension, Diabetes, Obesity, Liver and Kidney Diseases

PSRI HOSPITAL Celebrates WORLD KIDNEY DAY on 10th March, 2011

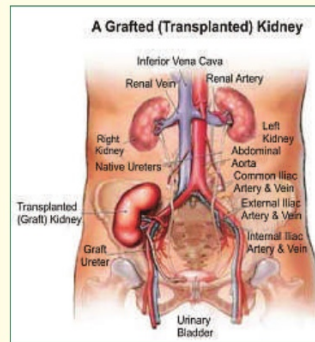

KNOW YOUR KIDNEY

Kidneys are one of the important organs for normal functioning of the body.

Smoking, high blood pressure, diabetes, indiscriminate use of pain killers and antibiotics can damage the kidney. Uncontrolled status of these ailments may lead to chronic renal failure.

Do you know that -

- (a) Strong family history of diabetes and hypertension requires regular screening of kidney diseases.
- (b) Early symptom of kidney disease may be easy fatigability, unexplained anaemia, loss of appetite, nausea, vomiting and swelling of feet.
- (c) Urine examination and serum creatinine are basic simple tests for kidney disease screening.
- (d) Chronic renal failure requires regular haemodialysis or peritoneal dialysis.
- (e) For the best quality of life, a kidney failure patient should opt for kidney transplant surgery.

FACTS ABOUT KIDNEY TRANSPLANTATION

Advantages of Kidney Transplant :

Better haemoglobin / No need for twice weekly trips to hospital for dialysis / No swelling of legs / Longer and better quality of life / No need for food or water restriction.

Who can donate Kidney?

Mother, father, sister, son, daughter, spouse having compatible blood group. Distant relatives are also considered, if no near relative is available or not fit for donation.

Is it safe to donate one of the Kidneys?

Donor's remaining kidney enlarges to take over the work of two. Donor leads a normal life after kidney donation. No medicines are to be taken by the donor after surgery. Donor gets a satisfaction of having given a life to someone.
